Joyce offers Bevel Gear Jacks in several designs including:
• Translating
• Keyed for non-rotation
• Keyed for traveling nut (KFTN)
A guide for ordering is on page 150.
**BEVEL GEAR JACKS**

**Ordering Information**

**Instructions:** Select a model number from this chart.

<table>
<thead>
<tr>
<th>Joyce Bevel Gear® Jacks</th>
<th>Bevel Gear Jack Rise</th>
<th>Screw Stops (p. 10) and Boots (pp. 170-173)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BG150S BG150D</td>
<td>Rise is travel expressed in inches and not the actual screw length.</td>
<td>Screw stops are optional on Bevel gear jacks. When specified, the closed height of the jack and protection tube length may be increased.</td>
</tr>

</table>

Follow the design tips (pp. 151-154).
Detailed product information (pp. 155-158).
Right hand screw threads standard.

**Sample Part Number:** **BG150SU2S-12.25-STDX-STDX-STDX-X**

**Additional Options***

| X=Standard Jack, no additional options |
| S=Additional Specification Required (comment as necessary) |
| Protective Boots pp. 170-173 |
| B=Protective Boot |
| D=Dual Protective Boot |

**Shaft Codes**

Three shaft codes must be specified for each jack. Electronic and mechanical limit switches may be substituted for the shaft code per the tables on this page.

- **STDX** – Standard
- **XXXX** – Input shaft not required
- **CUST** – Custom

When ordering with only one input shaft, it is recommended to order the following configuration:

**XXXX-STDX-XXXX**

**Encoders (pp. 176-177)**

- **ENCA**=Absolute Encoder 0-10 VDC, programmable
- **ENCB**=Absolute Encoder 4-20mA, programmable
- **ENCC**=Absolute Encoder CAN Open
- **ENCD**=Absolute Encoder SSI
- **ENCS**=Stainless Steel Incremental Encoder 1024 PPR
- **ENCX**=Incremental Encoder 200 PPR
- **ENCY**=Incremental Encoder 1024 PPR

**Shaft 1 Code**

- **U**=Upright
- **I**=Inverted

**Shaft 2 Code**

- **1=T1** (plain end)
- **2=T2** (load pad)
- **3=T3** (threaded end)
- **4=T4** (male clevis)

**Shaft 3 Code**

**Jack Configuration**

- **S**=Translating
- **K**=Keyed for Non Rotation
- **N**=Traveling Nut

**End Conditions**

- **1=T1** (plain end)
- **2=T2** (load pad)
- **3=T3** (threaded end)
- **4=T4** (male clevis)

**Jack Design**

- **S**=Translating
- **K**=Keyed for Non Rotation
- **N**=Traveling Nut

**Mechanical Limit Switches (p. 174)**

**Ordering Example:** **LA13**

BEVEL GEAR JACKS

SPECIFICATIONS AND DESIGN TIPS

### Design Tips:

1. A PV (pressure/velocity) value must be calculated for each application. The continuous running time should not exceed the corresponding T (time) value. Refer to instructions and graphs on pages 152 and 153.

2. Cooling time data on these charts is calculated based on limiting the lifting nut temperature rise from 70ºF to 200ºF (100º below dropping point of grease).

3. Check single lead versus double lead screws in each case. A double lead screw may be the appropriate choice due to increased efficiency while offering the same performance characteristics.

4. JAX® Online software is a useful design aid to determine the following:
   - The allowable static compression load for a given rise (or use Column Loading Chart on page 154)
   - The allowable dynamic load for a given rise
   - System horsepower and torque – also see item #5

5. When a direct motor drive is used in a system, consideration must be given to the input starting torque requirements and the motor horsepower will need to be increased accordingly (JAX® Online software data may require additional scrutiny). Contact Joyce for assistance.

6. When selecting multiple bevel gear jacks for an interconnected row or system (page 195) careful attention must be given to the input and output shaft rotations. For example, if the input shaft rotation on the first jack is clockwise, the output shaft(s) on that same jack will rotate counter-clockwise. To insure all jacks raise and lower in unison, alternating jacks must be specified with right and left hand acme screw threads. For example, if you have five jacks interconnected in a straight line and the first jack is right hand, the third and fifth jack will also need to be ordered as right hand and the second and fourth jack will need to be ordered as left hand. Bevel gear jacks are supplied standard with right hand acme screws. To order the left hand acme screw option, add an "L" to the end of your bevel gear jack part number as shown on page 150.

7. Joyce Bevel Gear® “S” Series (single lead) jacks are inherently self-locking. A brake is required for “D” series (double lead) jacks, which may lower under load.

8. Bevel gear jacks are furnished with one input shaft in position #2. Jacks may be ordered with up to three input shafts located at any combination of positions #1, 2, or 3.

9. Joyce Bevel Gear® jacks are designed for oil bath (EP-90 gear lubricant) or grease operation. The upper bearing is grease lubricated through a fitting on top of the jack. Grease must be applied directly to the lifting screw.

10. Typically jacks are mounted upright with the base plate parallel to the horizon. If the base plate is oriented any other way, contact Joyce for lubrication and other instructions.

</table>

Important Note: *Not self-locking, may lower under load. Brake motors or external locking systems are recommended.

**D**: Double Lead Screws.

**S**: Single Lead Screws. These jacks are self-locking.

**W**: Load in Pounds.

**Pinion Torque**: The torque required to resist screw rotation (translating jack design) and traveling nut rotation (keyed for traveling nut design).

**Lead**: The distance traveled axially in one rotation of the lifting screw.

**Pitch**: The distance from a point on the screw thread to a corresponding point on the next thread, measured axially.

†: Cooling time based on time to cool from 200°F to 70°F (ambient).

151
In many applications, Joyce Bevel Gear® jacks are more efficient and faster than wormgear driven jacks. To determine the suitability of a bevel gear jack for your application, use the steps below to calculate load, travel speed and duty cycle.

**Step 1** Determine load in pounds.

**Step 2** Determine velocity in feet / minute (fpm).

**Step 3** Determine duty cycle in terms of minutes operation / minutes resting (or time on / time off).

**Step 4** Calculate PV.

\[ PV = \frac{\text{load} \times \text{velocity in fpm}}{1000} \]

**Step 5** Calculate cooling time (T).

\[ T = \text{Cooling time (p. 151)} \times \frac{\text{time on}}{\text{time off}} \]

**Step 6** Plot the points for PV and T on the appropriate graph (below or on the next page). If the point falls below the line, the application is satisfactory. If it is above the line, recalculate T for the next larger size jack. Each jack size has a different cooling time (p. 151).

**Step 7** Calculate horsepower.

\[ \text{RPM} = \text{Velocity in fpm} \times 12 \times \text{input turns per one-inch travel} \text{ (from chart on p. 151)} \]

\[ \text{Horsepower} = \text{Pinion torque (from chart)} \times \text{load} \times \text{RPM} \]

**Note:** PV = load x velocity (fpm) / 1000

T = the maximum running time in minutes before a complete cooling time is required.

**BG150 S and BG150 D Bevel Gear Jacks**

- Single Lead Screw (lead 0.375 In.)
- Double Lead Screw (lead 0.500 In.)

**BG250 S and BG250 D Bevel Gear Jacks**

- Single Lead Screw (lead 0.500 In.)
- Double Lead Screw (lead 0.750 In.)
BEVEL GEAR JACKS  EXAMPLE AND THERMAL GRAPHS

Example: A 5000-pound load must be raised 30 inches in 15 seconds. The load remains in position for two minutes. It is then lowered and remains lowered for 30 seconds. The cycle begins again. Determine the appropriate bevel gear jacks and calculate horsepower required.

Step 1  Load = 5000 pounds

Step 2  Velocity = 30 inches in 15 seconds = 10 fpm

Step 3  Duty cycle = Time on / Time off

- Time on = 15 seconds up +15 seconds down = 30 seconds = 0.5 min
- Time off = 2 minutes up + 30 seconds down = 2 minutes 30 seconds = 2.5 minutes

Step 4  PV = (5000 x 10) / 1000 = 50

Step 5  T = 38 (for BG150) x (0.5 / 2.5) = 7.6

Step 6  The point for PV, 50, and T, 7.6 falls below the line for BG 150 D and above the line for BG 150S, therefore BG 150 D is appropriate. (reference BG150 chart on p. 152)

Step 7  RPM = 10 x 12 x 5.38 = 645.6

- Horsepower = (.066 x 5000 x 646) / 63,025 = 3.38

Note: PV = load x velocity (fpm) / 1000  T = the maximum running time in minutes before a complete cooling time is required.
The horizontal portion of each line represents the jack’s maximum static capacity.
